

V0_D (V0_c) / dl6 — CIN, inhibitory

V1 / V2b — ipsilateral, inhibitory

V2_a — ipsilateral, excitatory

V3 — CIN, excitatory

cross-side RG inhibition (F ↔ F strong,
E ↔ E weak); left-right alternation
= Shevtsova '26 RG-F → V0D → c-RG-F (−0.07)

RG-E ↔ RG-F half-center + PF reciprocal
inhibition + Ia reciprocal inhibition onto MNs
(flexor-extensor alternation; Renshaw-like)

RG → PF and PF → MN excitatory relay
= Shevtsova '26 RG-F → V2a → V0V chain
(also drives MN pools in the full models)

ABSENT in this circuit: every cross-side
connection is inhibitory (their model uses
V3-E/F for left-right synchrony at speed)

source: best_walk_params.json (study ground_walk_v4b_kine_pf_gain 2.18) on fitted refit | network size (live): 46 MN + 46x(3) sensory per side, +12 rhythm/pattern cells + 5 load-sharing INs per side; both sides + 8 shared = 410 neurons, 376 inputs

extensor-half drive, flexor-half drive, other excitatory, inhibitory, descending / balance
