syn6: fitted circuit, muscle allocation, and neural activity
Offline expected-afferent replay; not a physical walking run. Local reflex / commissural details are expanded separately.

(A) Fitted right-side RG → PF → MN architecture

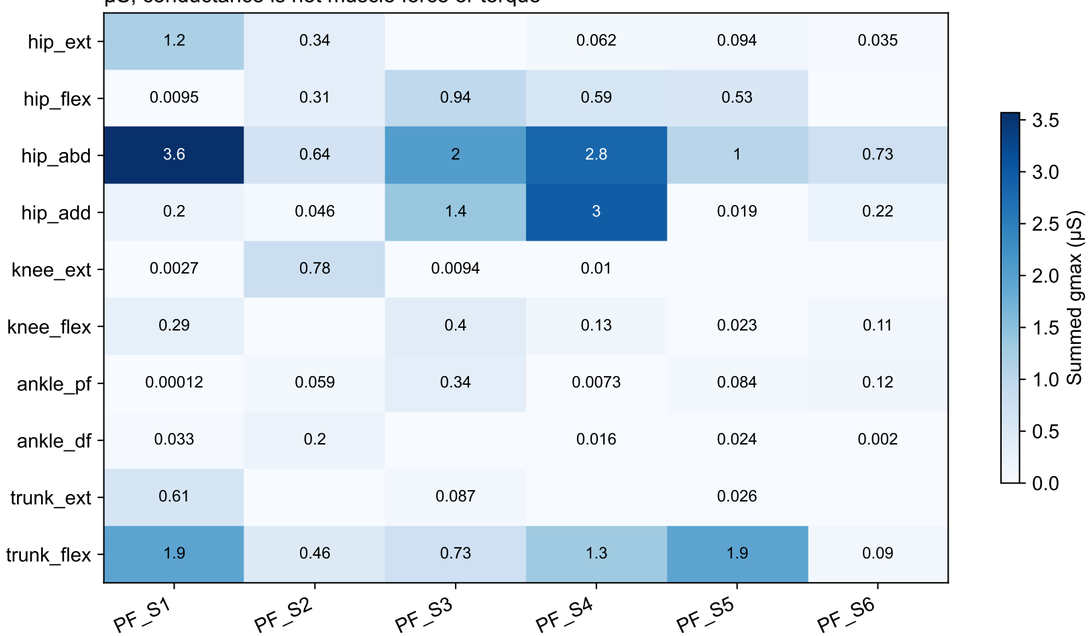

Shared MN box is a container, not all-to-all wiring.

Ia: 159 PF edges 6 target PF cells	II: 159 PF edges 6 target PF cells	Ib: 9 PF edges 3 target PF cells

Feedback: Ia/II → muscle-carrying PF channels; Ib → selected stance E channels.
Exact afferent-source / PF targets and signs are listed in the feedback panel.

(B) PF → MN: summed fitted conductance by primary muscle group
µS; conductance is not muscle force or torque

(C) Saved D replay: three reference cycles
