Submission audit: pending only

v5 | 30 October 2026 | Seven open groups | Current ProofFinal source lines

Only unresolved decisions and unfinished work are listed. Rejected and completed actions are removed. Yellow marks what remains open.

Dissertation

1. Original air-test and platform-drop evidence.

The chapter now shows a short, aligned native AnimatLab RG/PF/MN and joint-motion recording. It is the later instrumented configuration, not the original shared-RG course-project model. A paired original air-stepping recording with an identified antagonist pair/frequency is still needed to show that particular result quantitatively. The available phase-1 run contains an initial horizontal-force stimulus, not a timed platform drop; it cannot establish a touchdown response. Locations: §6.1, `60-sns.tex:8-31`; Appendix D model-recording section, `95-AppendixD.tex:27`.

2. Further diagram detail: select before insertion.

The native subsystem caption now uses bold prefix callouts, and the new short traces show the recorded hierarchy. A configuration-specific Gait2392 pathway diagram and the previously requested library/knee detail enlargement still need a figure choice. The diagram preview remains separate from the manuscript. An additional model/controller map is optional; the rewritten narrative already distinguishes the model families. Locations: §6.4.2, `60-sns.tex:112`; §6.4.3, `60-sns.tex:155-162`. Preview: `output/pdf/SNS_Diagram_Preview_20261030.pdf`.

3. Route-geometry readability: approved, unfinished.

Improve remaining contact/transmission labels and the main cam-pose frame/unit explanation. Use an initial bone-overlay view to orient the reader while retaining the distinction between the direct and cam routes. Locations: §4.3.3, `30-torque.tex:715`; §C.6, `94-AppendixC.tex:325,333`; §C.8, `94-AppendixC.tex:406`.

4. Torque authorship/contribution note: author decision.

The dissertation note names seven authors; the companion manuscript names four. No author list or contribution roles were selected by the agent. The published Morrow (2020) paper has no separate contribution statement. Its legacy placement work remains in the dissertation. Locations: Chapter 4 opening, `30-torque.tex:5`; paper front matter, `Main.tex:48,69`.

Companion paper: unchanged by this SNS revision

5. Small plot labels: approved, unfinished.

The six-panel pinned-extensor plot and supplementary route comparison need larger final-size labels through their generators, with every trace retained. Locations: §3.2, `Main.tex:441`; supplement §1.3, `frontiers_SupplementaryMaterial.tex:171`.

6. Identification settings table: approval pending.

Proposed: replace the long settings paragraph with one row for flexor identification and one for extensor identification, preserving memberships, bounds, solver settings, and the shared stiffness constraint. No optimization or FVU change. No table inserted. Location: §2.8, `Main.tex:382`.

7. Abstract hardware sentence: approval pending.

Proposed: "At the measured configurations, both redesigned routes met or exceeded the torque magnitude of their selected human-muscle references." This would include the tested flexor as well as extensor; no abstract edit was made. Locations: abstract, `Main.tex:81`; §4.3.2, `Main.tex:602`.

Unit formatting is resolved. The old knee startup comparison is archived rather than presented as current reflex evidence. The revised chapter uses verified, explicitly scoped runtime measurements; the approximate 240x and 8x ratios were not established from the recovered records. Zotero and the downloaded Overleaf ZIPs remain untouched. No live upload is included in this pass.
