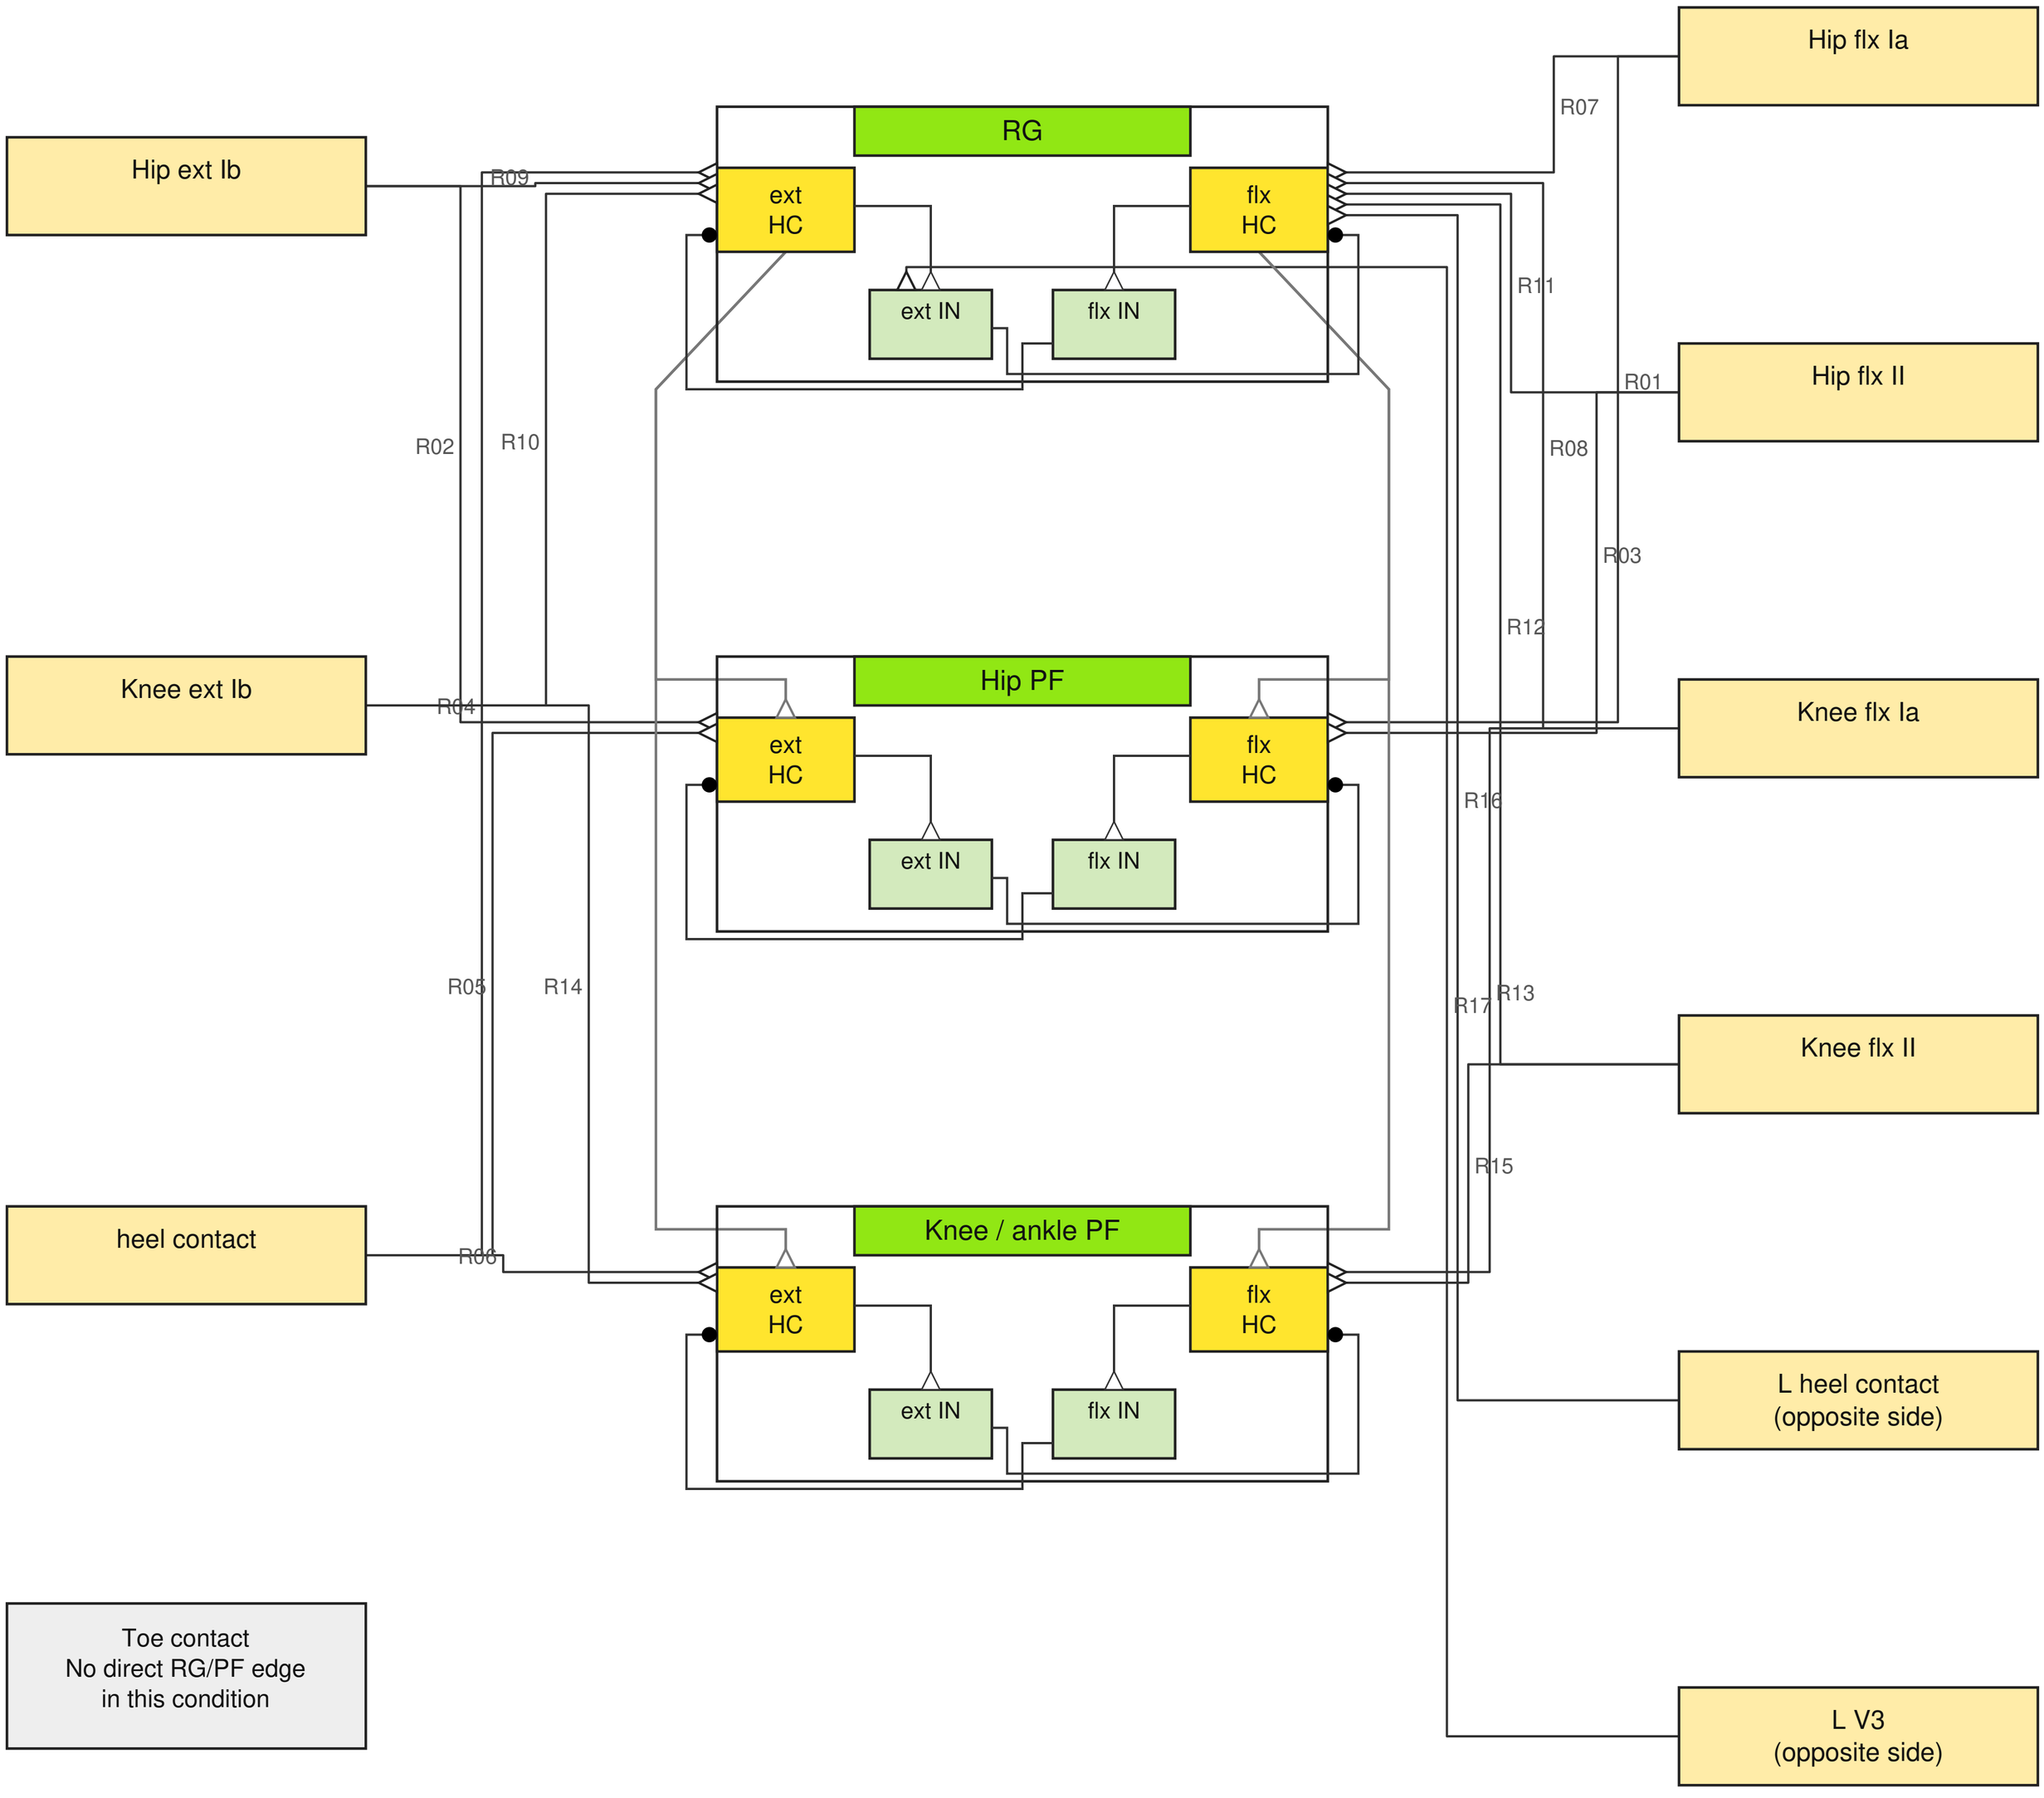
W2L108 · right central sensory feedback

Half-centres and interneurons shown explicitly; one source neuron per sensory box



Triangle base meets its receiving object; triangle point lies on the incoming line.

Filled circle: inhibition at target rest. Crossings without dots are not junctions.

Ia / II / Ib sensory boxes each represent one source afferent neuron, not a muscle bundle.

All direct afferent targets here are HCs; opposite-side V3 targets the RG extensor IN.

Other homonymous II and toe routes belong to motor/reflex circuits, not this central panel.
