Curation note

Classic formulation of the principles underlying nervous control of innate rhythmic motor acts in vertebrates, establishing the in vitro lamprey spinal cord preparation in which the locomotor motor pattern can be elicited in isolated cord sections for detailed mechanism analysis, and proposing that parts of the locomotor network are reused in other motor acts, including learned ones.

Robot/sim translation

Implement modular CPG subnetworks shared across multiple motor programs in a simulated swimmer or walker and verify that reuse preserves timing and stability while reducing controller complexity.
