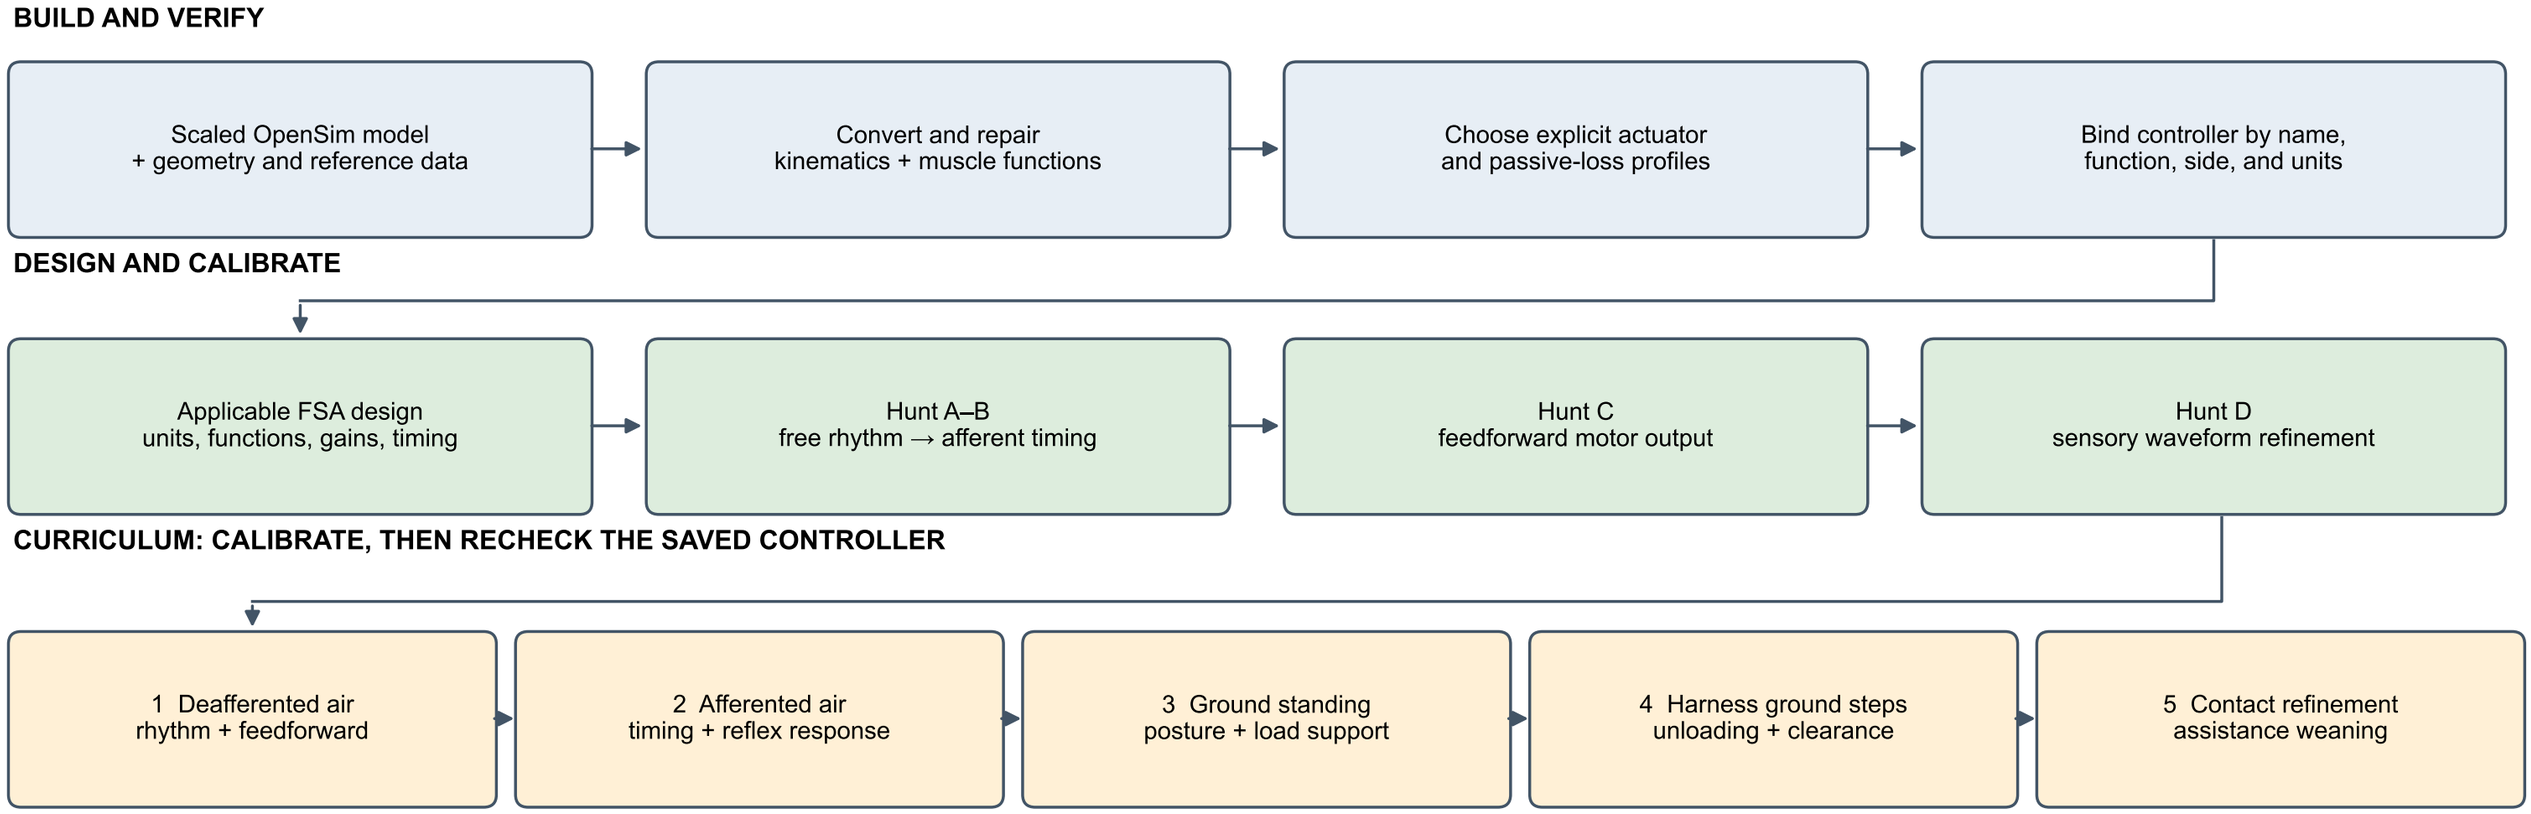
From a scaled model to a tested neuromechanical controller

Proposed orchestration using the existing conversion, design, training, and verification components



Hunt fitting operates within the curriculum; stages 1-2 calibrate and verify suspended motion.

IK/GRF bank → design ranges and targets → held-out participants, speeds, and trials

Cross-cutting tests: state, parameter, sensor, neural, mechanical, and actuator disturbances

Failure → diagnose the affected function → revise that block → repeat the relevant earlier gates

Szczecinski's seven steps apply to compatible GLIF pathways; graded and ionic circuits retain their appropriate design rules.
